                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention relates to humanised anti-lymphotoxin beta receptor (LT-beta-R) antibodies. These are derived from the murine LT-beta-R binding antibody CBE11 and can be used to treat neoplasia in humans. The present sequence is a humanised murine CBE11 heavy chain variable region
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New humanized anti-lymphotoxin-beta receptor antibody, useful for treating or reducing the advancement, severity or effects of neoplasia, particularly solid tumors (i.e. carcinomas) including colorectal cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           13-OCT-2000; 2000US-0240285P.

These are derived from the murine LT-beta-R binding antibody CBE11 and can be used to treat neoplasia in humans. The present sequence is a humanised murine CBE11 heavy chain variable region
                                                                                                                                                                                                                                                                                                     New humanized anti-lymphotoxin-beta receptor antibody, useful for treating or reducing the advancement, severity or effects of neoplasia, particularly solid tumors (i.e. carcinomas) including colorectal cancer and breast cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                           13-OCT-2000; 2000US-0240285P.

Pred. No. is the number of results predicted by chance to have
score greater than or equal to the score of the result being point
and is derived by analysis of the total score distribution.

      Pred. No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Score

  This invention relates to a new human antibody specific for human interlaukin-12 (II-12). The invention also includes antigen binding portions that bind to II-12. Sequences AAB39485-B39516 represent human anti-IL-12 antibody heavy and light chain complementarity determining region (CDR) amino acid sequences, and also includes variable region amino acid sequences. Other variable region amino acid sequences. Other variable region amino acid sequences and AB39517-B39560 and AAB40068-B40149. Sequences AAB39577-B40063 represent anti-II-12 CDR3 related amino acid sequences, AAB39772-B40063 represent other CDR3 sequences. Light chain CDR3 consensus sequences are given in AAB40064-B40067. Primers used in the identification and construction of the antibodies of the invention are given in AAC61062-C61071. The antibody of the invention is a neutralising antibody and has
  antirheumatic; antiarthritic; antisclerotic; antiinflammatory; neuroprotective; antipsoriatic; antiasthmatic; cardiant; antiparasitic; antibacterial and immunosuppressive activity. The antibodies or antigenbinding fragments are useful in the treatment of disorders associated with detrimental release of human IL-12, especially Crohn's disease, multiple sclerosis and rheumatoid arthritis. They can also be used in the manufacture of a pharmaceutical composition to treat human IL-12

The invention relates to an isolated nucleic acid comprising a sequence concoding a SARS coronavirus (SARS-CoV) spike injectoprotein (Sprotein), or the sequence has been optimized for expression in a comprising the above nucleic acid; (2) an isolated cell comprising the comprising the above nucleic acid; (2) an isolated cell comprising the expression vector of (1); (3) a polypeptide encoded by the above nucleic cetter (2); (3) a polypeptide encoded by the above nucleic cetter (4) an isolated polypeptide comprising an extracellular portion of cetter (4) an isolated polypeptide comprising an extracellular portion of cetter (4) an isolated antibody, or its antigen inding fragment, that specifically binds to the polypeptide of (3); (6) cetter (5); (10) an isolated antibody, or its antigen binding fragment, that specifically binds to an antibody, or its antigen binding fragment, and a pharmaceutical carrier; (8) making an Scattigen binding fragment, that specifically binds to an Sprotein of SARS-CoV; (10) evaluating an antibody, or its antigen binding fragment, that specifically binds to an Sprotein of SARS-COV; (11) evaluating an antibody, or its antigen binding fragment, of SARS-COV; (12) treating a subject at risk for, (2) evaluating an antibody, or its antigen binding fragment, for comprising the antibody, or its antigen binding fragment, for comprising the antibody, or its antigen binding fragment, for comprising the antibody, or its antigen binding fragment, for comprising the antibody of (5); (13) an isolated nucleic acid confolecule encoding the antibody, its antigen-binding portion, variable the expression vector (14); (16) a host cell comprising the antibody of (5); (18) an spot cell comprising human comprising the antibody of (5); (18) an host cell comprising human communication and or vector (14); (15) an expression vector (15); (17) a transgenic mammal comprising human comprising the mammal of (14); (16) a host cell comprising an expression vector (15); (17) a transgenic mammal comprising human comprisi
   New isolated nucleic acid encoding a SARS-COV spike glycoprotein polypeptide, and optimized for expression in a human host, useful for diagnosing, preventing and/or treating SARS-COV infection.

  The invention relates to an isolated polypeptide (I) comprising (a) one CC of 4 sequences: ARA10964, ARA10966, ARA10978 and ARA10978; or ARA10970 or CC ARA10972, and antibody heavy chain variable region. Or (b) ARA10988, and CC antibody light chain variable region. In (I), the antibody heavy chain or Clight chain variable region is a cynomolgus monkey antibody heavy chain or CC region. The antibody heavy chain variable region or cynomolgus monkey antibody light chain variable cregion. Also included are: an isolated polynucleotide (II) CC comprising a sequence encoding (I); an isolated antibody (Al) comprising CC a first polypeptide having SEQ ID No. 30; a method of evaluating (M1) the CC effects of an antibody, comprising introducing into a cynomolgus monkey a comprising the chain variable regions or cynomolgus monkey, and evaluating the effects of the cynomolgus monkey; and evaluating the effects of the chimeric antibody in the cynomolgus monkey, and evaluating the effects of the chimeric antibody in the cynomolgus monkey; an expression vector (V1) comprising (II); a cell CC (III) comprising V1; and a method of producing (I). (Al) further CC comprises a human antibody heavy chain variable region and a mouse antibody light chain variable region. (III) is useful for producing a chimeric antibody, which involves incubating CC antibody light chain variable region and a mouse antibody light chain voriable region. (III) candificant the chimeric antibody. (II) or (Al) further confidencies of the chimeric antibody, which involves incubating CC antison and cancer. The present sequence represents an anti-II-4R confidency chain variable and anti-II-4R confidency chain variable and anti-II-4R confidency chain variable and concer. The present sequence represents an anti-II-4R confidency chain variable and concer. The present sequence represents an anti-II-4R confidency chain variable region.

Example 3; SEQ ID NO 69; 138pp; English

The invention relates to an isolated polypeptide (I) comprising (a) one CC of 4 sequences: AEA10964, AEA10966, AEA10978; or AEA10970 or CC AEA10972, and antibody heavy chain variable region. In (I), the antibody heavy chain or CC light chain variable region is a cynomolgus monkey antibody heavy chain or CC variable region or cynomolgus monkey antibody light chain variable region. The antibody heavy chain variable region or light chain variable region is a human or mouse antibody heavy chain variable region or light chain variable region. Also included are: an isolated polymucleotide (II) comprising a sequence encoding (I); an isolated polymucleotide (II) comprising a sequence encoding (I); an isolated antibody (A1) comprising CC after polypeptide having SEQ ID No. 5, 8, 10, 12, 14 or 20, and a comprision of an antibody comprising introducing into a cynomolgus monkey a comprising introducing into a cynomolgus monkey and light chain and heavy chain variable regions from an antibody and light chain and heavy chain constant regions from a cynomolgus monkey, and evaluating the effects of the chimeric antibody in the cynomolgus monkey, and expression vector (V1) comprising (II); a cell (III) comprising V1; and a method of producing (I). (A1) further comprises a human antibody heavy chain variable region and a human comprise antibody light chain variable region and a mouse antibody heavy chain variable region. (III) under conditions suitable for expression of the chimeric antibody, antigen in biological samples, and for treating diseases such as HIV, inflammation and cancer. The present sequence represents an anti-II-4R

New isolated antibody that neutralizes botulinum neurotoxin type A, useful for diagnosing botulism or for treating pathologies associated with botulinum neurotoxin poisoning.

WPI; 2004-652009/63.

Marks JD,

Amersdorfer P;

(REGC ) UNIV CALIFORNIA.

Example 4; SEQ ID NO 167; 110pp; English.

The invention describes an isolated antibody (I) that specifically binds to an epitope specifically bound by an antibody expressed by a specific clone where (I) binds to and neutralises botulinum neurotoxin type A (BoNT/A). An isolated antibody (I) that specifically binds to an epitope specifically bound by an antibody expressed by a clone chosen from clone 25, C25, C39, ICG, 3D12, B4, IF3, huC25, A11, Ar2, WR1(Y), WR1(T), 3-1, 3-8, 3-10 and INGI, where (I) binds to and neutralizes botulinum neurotoxin type A (BoNT/A). Also described are: a polypeptide (II) comprising BoNT/A neutralising epitope having an epitope that is

  specifically bound by an antibody expressed by clones as mentioned in (I) producing (I), and a composition (III) comprising several antibodies, where each antibody is specific for a different epitope of a botulinum neurotoxin and the combination of antibodies shows greater toxin neutralisation than the single antibodies in surplus. The following are disclosed; a pharmaceutical composition comprising (I), and a kit comprising (I). (I) is useful for neutralising BONT/A antibody and for neutralising a botulinum neurotoxin which involves contacting neurotoxin with (I) in surplus, where each of (I) is specific for a different epitope of the botulinum neurotoxin and the combination of antibodies shows greater toxin neutralisation than the single antibodies in surplus. (I) is useful for diagnosing the botulism or for treating pathologies associated with botulinum neurotoxin pathologies associated with botulinum neurotoxin poisoning. (I) exhibits specificity and affinity towards BONT/A. (I) enables rapid detection or diagnosis of botulism. This is the amino acid sequence of mouse heavy chain anti-BONT-antibody CRD1.

  CC 3-8, 3-10 and ING1, where (I) binds to and neutralizes botulinum CC neurotoxin type A (BoNT/A). Also described are: a polypeptide (II) CC comprising BoNT/A neutralising epitope having an epitope that is CC specifically bound by an antibody expressed by clones as mentioned in (I) Cf. producing (I); and a composition (III) comprising several anticodies, where each antibody is specific for a different epitope of a botulinum neurotoxin antibodies, where each antibodies described are single antibodies in surplus. The following are disclosed; a pharmaceutical composition (CC intibodies shows greater toxin neutralisation than the single antibodies (I); and a kit comprising (I) is useful for neutralising comprising (I); and a kit comprising (I). (I) is useful for neutralising comprising (I) and a composition with (I) in surplus, where each of (I) is specific for a different epitope of the botulinum neurotoxin and the combination of antibodies shows greater toxin neutralisation than the CC single antibodies in surplus. (I) is useful for diagnosing the botulism CC or for treating pathologies associated with botulinum neurotoxin conduction or diagnosis of botulism. This is the amino acid composes rapid detection or diagnosis of botulism. This is the amino acid compose of mouse heavy chain anti-BoNT-antibody CRD1.

The invention describes an isolated antibody (I) that specifically binds to an epitope specifically bound by an antibody expressed by a specific clone where (I) binds to and neutralises botulinum neurotoxin type A

The present sequence is a polypeptide encoded by one of a large number of 5' ESTs derived from mRNAs encoding secreted proteins. The 5' ESTs were prepared from total human RNAs or polyA+ RNAs derived from 30 different

  CC (BoNT/A). An isolated antibody (I) that specifically binds to an epitope CC specifically bound by an antibody expressed by a clone chosen from clone CS 25, C25, C39, 1C6, 3D12, B4, 1F3, huC25, Ar1, KR1(V), WR1(T), 3-1, CC comprising BONT/A neutralising epitope dare: a polypeptide (II) CC comprising BONT/A neutralising epitope having an epitope that is CC specifically bound by an antibody expressed by clones as mentioned in (I) producing (I); and a composition (III) comprising several anticce different epitope of a botulinum neurotoxin antibodies, where each antibody is specific for a CC different epitope of a botulinum neurotoxin and the combination of CC comprising (I); and a kit comprising (I) is useful for neutralising a botulinum neurotoxin which CC comprising (I); and a kit comprising (I) is useful for neutralising ENOT/A antibody and for neutralising a botulinum neurotoxin which CC involves contacting neurotoxin with (I) in surplus, where each of (I) is specific for a different epitope of the botulinum neurotoxin and the combination of antibodies shows greater toxin neutralisation than the single antibodies in surplus. (I) is useful for diagnosing the botulism or for treating pathologies associated with botulinum neurotoxin cc enables rapid detection or diagnosis of botulism. This is the amino acid companies of mouse heavy chain anti-BoNT-antibody CRD1.

  tissues. EST sequences usually correspond mainly to the 3' untranslated region (UTR) of the mRNA because they are often obtained from oligo-dT primed cDNA libraries. Such ESTs are not well suited for isolating cDNA sequences derived from the 5' ends of mRNAs and even in those cases where longer cDNA sequences have been obtained, the full 5' UTR is rarely included. 5' ESTs are derived from mRNAs with intact 5' ends and can therefore be used to obtain full length cDNAs and genomic DNAs. 5' ESTs are also used in diagnostic, forensic, gene therapy and chromosome mapping procedures. They are used to obtain upstream regulatory sequences and to design expression and secretion vectors
  New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutatio responsible for genetic disorders or other traits and to assess

sequences. (I) is useful as hybridisation probes, polymerase Chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polymucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in

   record comprising all or part of the data, listed in the specification. The complex, polypeptides, polynucleotides and compounds are useful for preventing or treating metabolic disorders such as obesity or diabetes. The polynucleotides are useful as probes or primers. The complex is particularly useful for identifying selected interacting domains (SID (RTM)) for screening drugs that modulate the protein interaction, thus exhibiting the therapeutic effect. The present sequence represents a SID (prey) protein of the invention
The invention relates to a novel c-Met protein tyrosine kinase antibody or its antigen binding portion that specifically binds to c-Met. The c-Met antibody comprises any one of 1-60 fully defined sequence of 238, 244, 240, 250, 251, 242, 245, 247, 246, 253, 249, 243, 241, etc., amino acids as given in the specification, or its fragment. The invention further comprises: a pharmaceutical composition comprising the c-Met protein tyrosine kinase antibody and a carrier; an isolated cell that produces the c-Met protein tyrosine kinase antibody; and an isolated mucleic acid molecule that comprises a nucleic acid sequence that encodes a heavy chain or its antigen-binding portion of the c-Met protein tyrosine kinase antibody. The c-Met protein tyrosine kinase antibody has cytostatic,
  c-Met; tyrosine kinase antibody; antigen binding; cytostatic; ophthalmological; antiinflammatory; analgesic; vasotropic; antipsoriatic; osteopathic; cancer; tumour; ophthalmic disease; glaucoma; retinitis; retinopathy; uvesitis; ocular photophobia; macular degeneration; pain; acute injury; eye; hyperproliferative disorder; restenosis; angioplasty;
   Novel c-Met protein tyrosine kinase antibody or its antigen-binding portion specifically binding to c-Met, useful for manufacture of medicament for treating cancer or tumor and for treatment of ophthalmic diseases such as glaucoma.
  Human c-Met protein tyrosine kinase antibody, PGIA-2-A4

  CC provide for expression of a polynucleotide encoding a polypeptide from a CC microbial source. The invention also relates to a transformed plant CC comprising the recombinant DNA construct and a method of producing a CC transformed plant having an improved property. The plant is a crop plant CC such as maize or soybean. The method of producing a transformed plant CC having an improved property comprises transformed plant is a crop plant CC having an improved property comprises transformed plant, where the CC polynucleotide or polypeptide is useful for improving plant properties. CC improved plant properties, e.g. improved cold, heat or drought tolerance, increased resistance to plant disease, better growth rate by modification CC increased resistance to plant disease, better growth rate by modification of the cell cycle pathway with plant growth regulators, increased rate of CC content, improved yield by modification of protein yield and/or CC content, improved plant growth and development under at least one stress CC condition, improved lignin production of photosynthesis or by CC providing improved plant growth and development under at least one stress CC condition, improved lignin production of improved galactomannan CC production. Note: The sequence data for this patent did not CC form part of the printed specification but was obtained in electronic CC format from USPTO at seqdata.uspto.gov/sequence.html.

  밁
   CC The invention relates to the isolation of genes and their encoded CC proteins from Photorhabdus luminescens. The isolated sequences are CC sources of probes and primers for detecting the genome of P. luminescens CC and related species, to study polymorphisms, for gene analysis and for CC detection/amplification of the genes. Antibodies (Ab) raised against the CC polypeptides encoded by the genes are used for detection/identification CC of P. luminescens, e.g. in foods. The genes, proteins, Ab and cells that CC carry a gene-containing vector are used to select compounds that CC modulate, induce or inhibit expression of the genes in plants, CC animals or microorganisms other than P. luminescens and are able to alter response or sensitivity to toxins and antibiotics produced by P. CC luminescens. Cells transformed to express the genes are useful for CC entibacterials useful as insecticides, bacterides and fungicides. The genes, proteins, vectors containing the genes and Ab are also useful CC antibacterially (to treat microbial infection by bacteria or fungi that the sepseutically (to treat microbial infection by bacteria or fungi that CC are sensitive to P. luminescens-encoded toxins or antibiotics) and as biopositicides. Other uses of the genes and the proteins are as virulence CC factors and for identifying targets of human diseases for which P. CC luminescens is a model (particularly plague and whooping cough). This sequence represents one of the isolated P. luminescens proteins

The invention relates to a recombinant DNA construct comprising a CC promoter functional in a plant cell, where the promoter is positioned to CC provide for expression of a polynucleotide encoding a polypeptide from a CC microbial source. The invention also relates to a transformed plant CC transformed plant baving an improved property. The plant is a crop plant CC such as maize or soybean. The method of producing a transformed plant CC having an improved property comprises transforming a plant with the recombinant DNA construct and growing the transformed plant, where the CC polynucleotide or polypeptide is useful for improving plant with the recombinant DNA construct is useful for improving plant properties. The recombinant properties, e.g. improved cold, heat or drought tolerance, tolerance to herbicides; extreme osmotic conditions, pathogens or pests, increased resistance to plant disease, better growth rate by modification CC improved plant properties with plant growth regulators, increased rate of content, improved yield by modification of carbohydrate, nitrogen or phosphorus use and/or uptake, by modification of potcein yield and/or CC condition, improved lignin production or improved galactomannan CC condition, This sequence represents a bacterial polypeptide used in the growt of the printed specification but was obtained in electronic CC format from USPTO at sequence data for this patent did not correctly constructed and sequence.
   RESULT 13
ABB92826
  The invention relates to a recombinant DNA construct comprising a CC promoter functional in a plant cell, where the promoter is positioned to CC provide for expression of a polynuclectide encoding a polypeptide from a CC microbial source. The invention also relates to a transformed plant comprising the recombinant DNA construct and a method of producing a transformed plant comparising an improved property. The plant is a crop plant construct and growing an transformed plant construct and growing a transformed plant construct and growing the transformed plant construct and growing the transformed plant where the polynuclectide or polypeptide is useful for improving plant properties.

CC The recombinant DNA construct is useful for producing plant properties. The recombinant DNA construct is useful for producing plant properties. The recombinant DNA construct is useful for producing plant properties. The recombinant DNA construct is useful for producing plants with construct in the recombination of pathways plant proved cold, heat or drought tolerance, content, improved plant disease, better growth rate by modification of the cell cycle pathway with plant growth regulators, increased rate of content, improved yield by modification of carbohydrate, nitrogen or content, improved plant growth and development under at least one stress condition, improved plant growth and development under at least one stress condition, improved lignin production or improved galactomannan cc production. Note: The sequence data for this patent did not form part of the printed specification but was obtained in electronic format from USPTO at sequence.html.

   for herbicidally active compounds, comprising aligning and comparing nucleic acid or amino acid sequences from plant with nucleic acid or amino acid sequences from non-plant organisms using suitable search parameters, where plant sequences having an E-value greater by a factor of 3 than the E-value of most similar non-plant sequences are selected. The polypeptides or nucleic acids encoding them are useful for identifying modulators. The identified modulators are useful as
     The invention relates to primers for synthesising full length cDNA clones. 830 cDNA molecules encoding a human protein have been isolated and nucleotide sequences of 5'- and 3'-ends of the cDNA molecules have been determined. Primers for synthesising the full length cDNA are useful for clarifying the function of the protein encoded by the cDNA. The full length clones were obtained by construction of full length enriched cDNA
  organisms.
   Identifying plant target proteins for herbicidally active compounds, comprising aligning and comparing nucleic acid or amino acid sequences from plant with nucleic acid or amino acid sequences from non-plant

  libraries that were synthesised by the oligo-capping method. The primers enable the production of the full length cDNA easily without any special methods. The present sequence is a polypeptide provided in the specification. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in CD-ROM format directly from EPO
   This invention relates to a novel primer's useful for synthesising full length cDNA molecules that encode human proteins. Specifically, it refers to secretory or membrane proteins that are potential therapeutic agents/ target molecules in the field of medicine, and in particular genes encoding proteins that are associated with signal transduction, glycoproteins and transcription. The present invention describes a method for efficiently cloning a full length human cDNA from both the 5° and 3° ends using the oligo-capping method. This polypeptide sequence is a full length human protein of the invention.
   New oligonucleotide primers length human cDNAs.

   OM protein -
  Database
  Total number of hits satisfying chosen parameters:
   Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

The invention describes an isolated antibody (I) that specifically binds to an epitope specifically bound by an antibody expressed by a specific clone where (I) binds to and neutralises botulinum neurotoxin type A (BoNT/A). An isolated antibody (I) that specifically binds to an epitope specifically bound by an antibody expressed by a clone chosen from clone 25, C25, C39, IC6, 3D12, B4, IF3, huC25, A1, Ar2, WR1(V), WR1(T), 3-1, 3-8, 3-10 and ING1, where (I) binds to and neutralizes botulinum neurotoxin type A (BoNT/A). Also described are: a polypeptide (II) comprising BoNT/A neutralising epitope having an epitope that is

Example 4; SEQ ID NO 193; 110pp; English.

New isolated antibody that neutralizes botulinum neurotoxin type A, useful for diagnosing botulism or for treating pathologies associated with botulinum neurotoxin poisoning.

WPI; 2004-652009/63.

  specifically bound by an antibody expressed by clones as mentioned in (I) producing (I); and a composition (III) comprising several anticodition producing (I); and a composition (III) comprising several anticodition of a botulinum neurotoxin and the combination of cantibodies shows greater toxin neutralisation than the single antibodies in surplus. The following are disclosed; a pharmaceutical composition (C); and a kit comprising (I); and a kit comprising (I) is useful for neutralising comprising (I); and a kit comprising a botulinum neurotoxin which involves contacting neurotoxin with (I) in surplus, where each of (I) is specific for a different epitope of the botulinum neurotoxin and the combination of antibodies shows greater toxin neutralisation than the single antibodies in surplus. (I) is useful for diagnosing the botulism or for treating pathologies associated with botulinum neurotoxin poisoning. (I) exhibits specificity and affinity towards BONTA. (I) canables rapid detection or diagnosis of botulism. This is the amino acid of course of mouse heavy chain anti-BoNT-antibody framework region 3.

   invention. The antibodies can be used in the treatment of obesity and obesity related diseases. The antibodies can be used to deliver drugs or pro-drugs directly to the fat mass of an obese patient or the antibody can be used as a therapeutic itself. Antibodies binding specifically to adipocytes can be used to activate the immune system to destroy the cells by complement mediated lysis. The antibodies may be labeled with a detectable label such as radiolabel, fluorescent or chemical group and used in methods of diagnosis in human subjects e.g. to determine the presence of adipocyte antigen on the surface of an adipocyte to detect or determine the presence or level of adipocytes in a cell or tissue sample. The antibodies can be used as an alternative means of treatment for obese patients other than undergoing surgery to remove excess fat. Antibodies for different types of fat deposits can also be produced e.g. intra-abdominal fat associated with heart disease

A human anti-CD40 monoclonal antibody or fragment useful for inhibiting prollferation, growth or differentiation of a normal human B cells and treating autoimmune disease such as rheumatoid arthritis or systemic erythematosus.

Claim 8; Fig 6; 75pp; English.

The invention relates to a human monoclonal antibody or fragment capable of specifically binding to a human CD40 antigen (a glycoprotein expressed on the surface of human B cells), where the antibody or fragment is free of significant agonistic activity when it binds to the CD40 antigen, and the growth or differentiation is inhibited. The fragments comprise the complementarity determining region (CDR) of the light and heavy chains of the monoclonal antibodies secreted by a hybridoma consisting of 1588, 2024, 12D9, 9F7 and 13B4. Also included are the nucleic acids encoding

CC Cel Inh The invention relates to a human monoclohal antibody or fragment capable of specifically binding to a human CD40 antigen (a glycoprotein expressed on the surface of human B cells), where the antibody or fragment is free of significant agonistic activity when it binds to the CD40 antigen, and the growth or differentiation is inhibited. The fragments comprise the complementarity determining region (CDR) of the light and heavy chains of the monoclonal antibodies secreted by a hybridoma consisting of 15B8, 20C4, 12D9, 9F7 and 13E4. Also included are the nucleic acids encoding the antibody (or fragments). The antibodies or fragments are used for inhibiting proliferation, growth or differentiation of a normal human B cells and to inhibit antibody production by B cells. They may also be useful for treating autoimmune diseases, such as systemic lupus erythematosus, psoriasis, multiple sclerosis, inflammatory bowel disease crythm's disease' and lumnhous (sensecially Non-

The present invention relates to antibodies 18 and 22, (A1) which bind to insulin like growth factor I receptor (IGF-IR). The antibody is capable of inhibiting the binding of IGF-I and IGF-II to IGF-IR, and is of the IGG1 isotype. The antibodies induce cell death of 20% or more cells of a preparation of IGF-IR expressing cells by antibody dependent cellular toxicity (ADCC). (A1) are useful for making a pharmaceutical composition

The present invention describes a human monoclonal antibody (I) that specifically binds to tumour necrosis factor-alpha (TNPa) and comprises: (a) a heavy chain complementarity determining region 1 (CDR1) having the two fully defined 5 amino acid sequence (S1, ADP22417) or (S2, ADP22421); and (b) a light chain CDR1 having the two fully defined 11 amino acid sequence (S3, ADP22418) or (S4, ADP22424). Also described: (1) assaying (M1) the level of TNPa in a patient sample, comprising contacting with (I), and detecting the level of binding between the antibody and TNPa in the sample; (2) a composition comprising the antibody or its functional fragment and a carrier; (3) treating (M2) an animal suffering from a

  method comprises providing a first molecule and a second molecule, where creation of the first and second molecules leads to the generation of a signal; providing a single intracellular immunoglobulin domain which is associated with the first molecule, where the single immunoglobulin domain is free of complementary immunoglobulin domains; providing an intracellular target which is associated with the second molecule, such that association of the immunoglobulin domain and the target leads to stable interaction of the first and second molecules and generation of the signal, and assessing the intracellular interaction between the immunoglobulin domain and the target by monitoring the signal. The methods are useful for determining the ability of an immunoglobulin single domain to bind to a target in an intracellular carried environment. The present sequence is that of a single chain variable fragment (scFv) protein which was used to illustrate the method of the

   8
   Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

   Pred. No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.
